PROFESSIONAL SUMMARY

Software Engineer with 2+ years of experience building Backend and Fullstack web applications using Node.js, React, Spring Boot, MongoDB, AWS, and Python, delivering REST APIs and real-time WebSocket-based application workflows in U.S.-based environments. Improved production reliability through structured logging, health checks, retry-safe synchronization pipelines, and CI/CD automation using GitHub Actions and Docker, enabling stable releases and faster issue resolution. Contributed to scalable Backend and Front-end application features that reduced latency by 25% and supported 100+ concurrent users across distributed web platforms.

TECHNICAL SKILLS

Programming Languages: Python, JavaScript, Java, C#.

Backend Development: Node.js, Spring Boot, REST API development, WebSockets, Microservices fundamentals, Event-driven processing, Retry logic, Idempotency handling, Backend application development.

Frontend Development: React.js, Responsive web interfaces, Component-based architecture, Front-end application integration.

Databases: MongoDB, PostgreSQL, MySQL, SQL query optimization, Backend data modelling.

Cloud & Platform Technologies: AWS (Lambda, API Gateway, S3, CloudFront, EC2, CloudWatch), Azure fundamentals, Backend service deployment, Platform reliability improvements.

Software Engineering Practices: Application design, Fullstack web development, Offline-first workflow handling, Structured logging, Telemetry, Health checks, Error handling strategies, Software reliability improvements.

DevOps & CI/CD: Git, GitHub Actions, Jenkins, Docker, Release automation pipelines.

Testing & Observability: Monitoring, Performance debugging, Load testing, Service diagnostics.

Developer Tools: Linux/Unix, GitHub, Jira, Postman.

PROFESSIONAL EXPERIENCE

Software Engineer

Jul 2025 - Present

Andbounds

- Designed a Backend application upload pipeline using Node.js and MongoDB that stored scan data locally and synchronized automatically after connectivity recovery, preventing field data loss and improving capture reliability by 38%.
- Implemented Software Engineer-level structured logging and telemetry workflows using CloudWatch and service diagnostics, reducing incident triage time for support teams by 27%.
- Engineered REST API retry and idempotency handling across mobile-to-backend integrations, improving transaction consistency during unstable network conditions.
- Optimized Backend service restart strategies using PM2 process management, reducing deployment-related downtime across production environments by 22%.
- Strengthened Application reliability by introducing health-check endpoints and service monitoring integrations that improved production visibility for Platform engineering stakeholders.
- Collaborated with Frontend developers and hardware integration teams to stabilize scan lifecycle workflows across mobile capture devices and backend processing services.
- Automated deployment validation pipelines using GitHub Actions and Docker to support consistent release workflows across staging and production environments.
- Supported cross-team backlog delivery planning in Jira by identifying API dependencies early and coordinating release sequencing across Web, mobile, and backend application layers.

Software Development Engineer

Sep 2024 - May 2025

The Piper LLC

- Developed Backend WebSocket-based ride lifecycle synchronization services using Node.js that maintained real-time trip state transitions across rider-driver sessions.
- Implemented Front-end session persistence logic using React state recovery workflows that restored active ride status after app reconnection events, improving booking continuity by 31%.
- Built Application-level event-driven status propagation pipelines supporting match-to-completion ride workflows across distributed service endpoints.
- Validated API contract handling between Backend microservices and mobile clients using structured response verification, reducing edge-case failures during reconnection scenarios by 24%.

- Enhanced Fullstack Developer collaboration with backend teams to align WebSocket payload formats and lifecycle state transitions across trip orchestration modules.
- Reduced application failure states by introducing reconnect-safe retry handling inside frontend service adapters supporting intermittent connectivity scenarios.
- Integrated monitoring checkpoints across Backend ride-processing endpoints enabling Platform engineering teams to trace lifecycle anomalies faster.
- Partnered with cross-functional product stakeholders to refine trip-state transition logic supporting consistent user experience across Web and mobile application layers.

Software Engineer

Jan 2024 - Nov 2024

Arizona State University

- Engineered Spring Boot Backend REST API integrations supporting live classroom attendance ingestion workflows connected to ASU ID scanner devices, reducing manual attendance tracking time by 70%.
- Developed React-based Front-end application components with reusable state-controlled UI modules improving maintainability across instructor session workflows.
- Collaborated with university infrastructure teams to integrate scanner hardware inputs with Backend session validation services supporting lecture hall deployments.
- Optimized SQL-backed attendance retrieval endpoints improving Web dashboard load performance by 25% during concurrent classroom access periods.
- Implemented CI/CD automation pipelines using GitHub Actions supporting controlled deployment of application updates across testing environments.
- Executed load testing simulations for 100+ concurrent classroom users validating service stability across peak attendance submission windows.
- Strengthened Backend data modeling workflows supporting reliable student-session mapping across lecture ingestion pipelines.
- Partnered with academic stakeholders and Platform technologists to align application behavior with classroom operational requirements and institutional reporting workflows.

PROJECTS

Real-Time Delivery Tracking System

- Architected a real-time Web tracking application using Node.js and WebSockets to stream live vehicle location updates, enabling continuous trip visibility across active delivery sessions.
- Implemented a React-based Front-end mapping interface integrated with route visualization APIs to display trip lifecycle transitions and improve monitoring clarity for dispatcher-style workflows.
- Deployed the Backend application on AWS using EC2 and CloudWatch monitoring to validate stable event-stream delivery under concurrent tracking simulations.

AI Resume & Job Match Analyzer

- Designed a Python-based semantic similarity pipeline using embeddings to evaluate resume-job alignment and generate structured improvement insights for role-matching scenarios.
- Developed a Node.js Backend processing service integrated with AWS Lambda, API Gateway, and S3 to handle secure document ingestion and orchestrate scoring workflows with caching support.
- Delivered a responsive React Front-end upload interface enabling users to compare resumes against job descriptions and review actionable application-alignment feedback efficiently.

EDUCATION

Bachelor of Science in Computer Science

May 2021 - May 2025

Arizona State University | Tempe, AZ
